

5.1.2.

Write the first four terms of the sequences defined by the formulas in 1–6.

$$b_j = \frac{5-j}{5+j}, \text{ for every integer } j \geq 1$$

We must show a_1, a_2, a_3, a_4 .

$$a_1 = \frac{5-1}{5+1} = \frac{4}{6} = \boxed{\frac{2}{3}}$$

$$a_2 = \frac{5-2}{5+2} = \boxed{\frac{3}{7}}$$

$$a_3 = \frac{5-3}{5+3} = \frac{2}{8} = \boxed{\frac{1}{4}}$$

$$a_4 = \frac{5-4}{5+4} = \boxed{\frac{1}{9}}$$

Solution: $a_1 = \frac{2}{3}, a_2 = \frac{3}{7}, a_3 = \frac{1}{4}, a_4 = \frac{1}{9}$
